

TELEPHONIC-INTERFACE LOTTERY SYSTEM

Abstract of the Disclosure

A telephonic-interface lottery system D interfaces with a multiplicity of individual terminals T1-Tn of a telephone network facility C to enable lottery players to call and

- 5 play for at least one additional chance to possibly win by dialing a pay-to-dial telephone number indicated on a "scratch-off" or online game lottery ticket for use in the system.

At the terminals, callers are prompted by voice-generated instructions to provide digital data, such as their telephone number, age, social security number, and/or drivers license

number. In addition, the sequence number of the caller as well as the date and time of the

- 10 call is recorded for positive association with a caller and is stored for processing. The

caller's identification data is confirmed using various techniques and callers may be

ranked and accounted for on the basis of entitlement-and sequence. In accordance with

one format, an instant winner is selected online by utilizing techniques such as

determining a random winning sequence number or a winning lottery number generated

- 15 by a number generator. As an adjunct or alternative, the identification data is processed

at a later time to determine a grand prize drawing winner by using various processing

techniques for determining winners.
